Alfred Holl

The role of cooperative cyclic knowledge gain in IS anti-aging

1. IS modification as process of cooperative cyclic knowledge gain
   1.1 Cooperative knowledge gain: multi-perspectivity of IS experts and org. / domain experts
   1.2 Cyclic knowledge gain: mayeutic cycle

2. IS anti-aging supported by cooperative cyclic knowledge gain
   2.1 Fundamental definitions
   2.2 IS anti-aging methods during the analytic phase
      2.2.1 Requirements engineering
      2.2.2 Open and dynamic models: local and temporal extrapolation
   2.3 IS anti-aging methods during the synthetic phase
      Changed / creeping requirements management
   2.4 IS anti-aging methods during maintenance
      2.4.1 Types of IS maintenance
      2.4.2 IS maintenance types and their relation to Lehman’s laws of SW evolution
      2.4.3 Change management
      2.4.4 IS reengineering
1. IS modification as process of cooperative cyclic knowledge gain

Organizations (profit and non-profit) are open, complex psycho-social,
→ mutual influence of observer and observandum (1.1)
dynamic
→ temporal dynamics of organizations (1.2)

organizational information systems.

In this presentation, ‘IS’ always means the science IS or a technical IS.
1.1 Cooperative knowledge gain:
multi-perspectivity of IS experts and organization / domain experts

Systems are relative to perspectives (adapted from Steinmüller 1993, 168)
1.1 Cooperative knowledge gain: multi-perspectivity of IS experts and organization / domain experts

Multi-perspectivity in project management (passim on the Internet)
1.2 Cyclic knowledge gain: mayeutic cycle 1

Mayeutic cycle in IS and natural sciences (according to Holl 1999, 175)
1.2 Cyclic knowledge gain: mayeutic cycle 2

BPM life cycle (Wetzstein et al., SBPM 2007, p. 4)
1.2 Cyclic knowledge gain: mayeutic cycle 3

A spiral model of software development and enhancement (adapted from Sommerville 2001, 614 according to Boehm 1988)
1.2 Cyclic knowledge gain: mayeutic cycle 4

Embedded mayeutic cycle in IS research
(adapted from Hevner / March / Park / Ram 2004, 80)
1.2 Cyclic knowledge gain: mayeutic cycle 5: cycles of knowledge gain
1.2 Cyclic knowledge gain: mayeutic cycle 6

The cycle of cognitive gain, hence the growth of knowledge and certainty according to Erhard Oeser’s theoretical system-functional model of the dynamics of theories. The symmetries contained in this algorithm correspond to those which were found prepared in the phylogeny of biological cognitive processes. It is only that they are more differentiated at the level of epistemology (from Oeser 1976; extended into biological history).

Conic helix of knowledge gain (Riedl, Biology of knowledge 1984, 169)
2. IS anti-aging supported by cooperative cyclic knowledge gain

2.1 Fundamental definitions

Permanent changes on the organizational level require permanent changes on the IT level which lead to software aging.

2.1.1 Types of software aging (Parnas 1994, 280)

- functional aging (lack of movement): no changes at all
- qualitative aging (ignorant surgery): important in this context

2.1.2 Lehman’s SPE classification (Lehman 1980, 1061-1063)

In the area of IS, only Lehman’s E-type systems / programs are considered. (→ 2.4.2 Lehman’s laws of software evolution)
2.1.2.1 **S-type systems: specifiable**

An IT system belongs to type S if one can prove that a previous specification is mathematically correct.

- Requirements are described completely
- Problem does not change
- Acceptance: mathematical correctness
- Improvement is impossible

Examples: inversion of matrices; solution of equations, World-3 problems
2.1.2.1 S-type systems
2.1.2.2 P-type systems: problem-solving

P-type systems are solutions for limited problems which cannot be described completely on a formal level.

- A complete formalization is impossible
- The problem is simplified
- The problem on reality level is not solved
- Acceptance via use
- Continuous improvement

Examples: weather forecast; World-1 problems
2.1.2.2 P-type systems
2.1.2.3 E-type systems: embedded

E-type systems are embedded in open, dynamic, complex, social (socio-technical) information systems (organizations).

• Automation of human or social activities
• Requirements are not clear
• Acceptance: the user is content
• Continuous improvement

Examples: business information systems; World-2 problems
2.1.2.3 E-type systems
2.1 Fundamental definitions

Every anti-aging method mentioned in the following sections will cover each of the two knowledge gain aspects from Chapter 1:
- cooperative
- cyclic

Overview

![Requirements and IS life cycle (Holl / Paetzold / Breun 2011, p. 33)](image)
2.2 IS anti-aging methods during the analytic phase

2.2.1 Requirements engineering

Life cycle of a requirement
(Holl / Maydt 2007, 6; adapted from Partsch 1998, 27)
2.2 IS anti-aging methods during the analytic phase

2.2.1 Requirements engineering

The psychiatric approach of neuro-linguistic programming by R. Bandler / J. Grinder used in Rupp, Chris: RE. München 1st ed. 2001 tries to find the underlying meaning of utterances produced by means of transformations (cf. Freud’s projection to others and exaggerated contrary)

Deletion

Implicit assumptions, incomplete properties:
- *easily changeable*: how easily? what’s easy? by whom?

Incomplete verbal nuclei/kernels
- (missing objects and adverbials; cf. dependence grammar):
  - *SW shall inform about errors*: whom? where? how? when?
  - *the development of a SW tool*: who develops? when? why?
2.2 IS anti-aging methods during the analytic phase

2.2.1 Requirements engineering

**Generalization**
Universal quantifiers:

*every error*: really every? any exceptions?

Incomplete conditions:

*If the error X occurs in the last phase of program Y, then ...*

What should be done if it occurs in another phase?

Definite article without text reference:

*the error*: which?

**Distortion**

Nominalization: resulting event instead of process

*loss of data*: which data are lost? when? how? why?
2.2 IS anti-aging methods during the analytic phase

2.2.2 Open and dynamic models 1: local extrapolation

Examination of other application areas which already exist

Data model before and after local extrapolation
(Holl / Paetzold / Breun 2011, p. 36-37)
2.2 IS anti-aging methods during the analytic phase

2.2.2 Open and dynamic models 2: temporal extrapolation

Examination of future developments

Millennium bug (Y2K)
2.3 IS anti-aging methods during the synthetic phase

Changed / creeping requirements management / engineering

![Graph showing changed requirements gap](image-url)
2.4 IS anti-aging methods during maintenance

The iceberg of IS maintenance (Martin / McClure, 1983, p. 7)
2.4 IS anti-aging methods during maintenance

2.4.1 Types of IS maintenance

( refined from Swanson 1976, 492-497 and Kroha 1997, 181)

Only types specific for E-type systems are considered.

- technical-corrective
- business-corrective
- technical-adaptive
- business-adaptive \( \rightarrow \) change management
- technical-perfective \( \rightarrow \) reengineering
- business-perfective \( \rightarrow \) vs. excellent requirements engineering
- technical-preventive
- business-preventive \( \rightarrow \) extrapolation
2.4.2 IS maintenance types and their relation to Lehman’s laws

2.4.2.1 Software Evolution

Change of IT systems during their life cycle
vs. biologic evolution: change of species
Ontogenesis vs. phylogenesis
2.4.2.2 Lehman’s laws of software evolution

(Lehman / Belady 1972 etc.)
2.4.2.3 Applications of Lehman’s laws (legacy systems)

Increasing complexity of E-type systems (Holl / Paetzold / Breun 2011)
2.4.2.3 Applications of Lehman’s laws 2

Progressive and anti-regressive costs over time
2.4.2.3 Applications of Lehman’s laws

Progressive and anti-regressive costs over time
2.4.3 Change management

Mayeutic cycle of IS maintenance (Holl /Paetzold / Breun 2011, p. 45)
2.4.3 Change management

Bottom-up SW development (Sneed, SW maintenance, 1991, fig. 2.10)
2.4.4 Reengineering

Reengineering process
(adapted from http://mlecture.uni-bremen.de/intern/ws2005_2006/fb03/vak-03-706.1/20051024/folien.pdf according to Chikofsky / Cross II, 1990)
2.5 Summary

Anti-Aging starts with the beginning of the analytic phase of the software process and has to be considered throughout the entire software process and every maintenance step.
